

CareerBuilder Mobile Responsiveness & UI Enhancements

Overview

A comprehensive UI hardening pass was performed to ensure the CareerBuilder platform is fully responsive and offers a seamless experience across mobile (375px+), tablet (768px+), and desktop (1024px+) devices.

Implemented Fixes

1. Viewport Meta Tag Verification

- Verified that the `viewport` meta tag with `width=device-width`, `initial-scale=1`, `maximum-scale=1` exists in the root layout to prevent mobile browsers from incorrectly zooming out.

2. Kanban Board Mobile Fix (`src/app/tracker/page.tsx`)

- **Drag & Drop:** Integrated `MouseSensor` alongside `PointerSensor` and `TouchSensor` in the `dnd-kit` setup for reliable touch dragging on mobile devices.
- **Layout:** Replaced the horizontal scrolling layout with a vertical stacked layout on mobile (`flex-col` to `sm:grid`).
- **Touch Targets:** Increased tap targets for the drag handle and delete button to a minimum of 44x44px.

3. Data Visualization Responsiveness (`src/app/dashboard/page.tsx` & `src/app/recruiter/page.tsx`)

- Verified that all `Recharts` components (`BarChart`, `PieChart`) are wrapped in `<ResponsiveContainer width="100%" height="100%">` with fixed height parent divs to ensure proper scaling on all screens.

4. Navbar Mobile Hamburger Menu (`src/components/Navbar.tsx`)

- Adjusted breakpoints from `sm` to `md` (768px) to trigger the hamburger menu earlier for tablet screens.
- Increased touch target sizes for the hamburger menu button and theme toggle to 44x44px.

5. Recruiter Portal Responsive Grid (`src/app/recruiter/page.tsx`)

- Verified the use of responsive grid layouts (`grid-cols-1 md:grid-cols-2 lg:grid-cols-3`).
- Increased touch target sizes for "Shortlist Candidate", "View Resume", "Email Candidate", and modal close buttons to `min-h-[44px]`.

6. Jobs Page Card Grid (`src/app/jobs/page.tsx`)

- Adjusted the responsive grid to `grid-cols-1 sm:grid-cols-2 lg:grid-cols-3 gap-4` to display 1 column on mobile, 2 on tablet, and 3 on desktop.
- Increased the touch target size for the mobile filter drawer close button.

7. Chatbot Floating Widget Mobile Fix (`src/components/Chatbot.tsx`)

- **Overlay:** Modified the chatbot window to open as a full-screen overlay (`fixed inset-0 z-[60]`) on mobile devices, while retaining the floating panel on desktop.
- **Safe Area:** Added `padding-bottom: env(safe-area-inset-bottom)` to the input container to prevent iOS keyboard overlap.
- **Touch Targets:** Increased the send button and close button tap targets to 44x44px.

8. Auth Pages Scroll on Mobile (`src/app/login/page.tsx` & `src/app/register/page.tsx`)

- Modified the main container layout from `items-center` to `overflow-y-auto` and `m-auto` for the child card.
- Added padding at the bottom (`pb-[max(2rem,env(safe-area-inset-bottom))]`) to ensure buttons are fully visible and accessible on smaller screens like the iPhone SE.

9. Universal Responsive Containers

- Reviewed the codebase for fixed-width containers. Replaced problematic `w-[600px]` instances with `w-full md:w-[...]` utility classes to prevent horizontal scrolling and overflow on mobile devices.

10. Notifications Page Full-Width Mobile Cards

- Applied `w-full` to cards while removing container padding on mobile (`px-0`) to ensure the cards reach the edge of the screen on 375px devices.
- Expanded the `mailto:` link target to `min-h-[44px]` for mobile-friendly tapping.

11. Profile Page Mobile Stacking

- Enforced a true vertical stack on mobile by adjusting flex directions (`flex-col items-center sm:items-start`) so that the avatar cleanly centers above the user details on 375px screens.

12. Global Horizontal Scroll Prevention (`globals.css`)

- Applied `overflow-x: hidden` and `max-width: 100vw` to the `html` and `body` tags globally to prevent any accidental horizontal scrolling or shifting issues entirely.
